simply look at the number of fatalities. The level of bicycling and walking in an area also must be taken into account to determine what the risk of bicycling or walking is. For example, if a city had just 100 people who bicycled and had one bicycle fatality and another city had 6,000 people who bicycled and had two bicycle fatalities, the first city would have a higher fatality rate. If 1 out of 100 bicyclists was a victim of a traffic fatality, the risk in that community would be much greater than the one where two out of 6,000 bicyclists died in traffic.

To measure risk, the Alliance divided the number of annual bicycle and pedestrian fatalities by population (weighted, or multiplied, by share of the population biking and walking to work). Multiplying population times commuter mode share allows us to better estimate exposure levels for bicycling and walking. Unlike the ACS, national travel surveys including all trip purposes have sample sizes that are too small to disaggregate to the state and city level. Thus, our method is a rough approximation of exposure levels that takes both population and cycling levels into account. Exposure data are rough approximations and fatalities can vary greatly from year to year. Thus, all fatality rate data should be interpreted as rough estimates of risk, and not as the exact risk level for any city or state.

FARS and ACS data indicate that nationwide, 4.2 bicyclists are killed per year per 10,000 daily bicyclists. Bicy-

Sources: FARS 2007-2009, ACS 2007-2009 **Notes:** This ranking is based on the fatality rate which is calculated by dividing the number of annual bicycle fatalities (averaged between 2007-2009) by population (weighted, or multiplied, by share of the population biking to work). View these data on pages 56 and 57 of this report.

Bicyclist and pedestrian fatality risk is lower in major U.S. cities.

clists are safer in major U.S. cities(1) where the fatality rate is 2.4 fatalities per year per 10,000 daily bicyclists. South Dakota and Vermont are the safest states for bicycling with 0 deaths per 10,000 daily bicyclists. Mississippi is the most dangerous state for bicycling (14.1 deaths per 10,000 daily bicyclists) followed by South Carolina (13.5 deaths per 10,000 daily bicyclists). Honolulu, Milwaukee, and Omaha report no bicycle fatalities in the years studied. Washington, DC, Portland, OR, and San Francisco are the next safest cities for bicycling with fatality rates of 0.5, 0.9, and 0.9 deaths per 10,000 daily bicyclists, respectively. Charlotte, Arlington, TX, and Jacksonville are the least safe major cities for bicycling with 18.5, 14.5, and 14.2 bicyclists killed per 10,000 daily bicyclists, respectively.

Pedestrians are similarly safer in major U.S. cities where 4.0 pedestrian fatalities occur each year for every 10,000 daily pedestrians. In states, there are 5.0 pedestrian deaths per 10,000 daily pedestrians. Vermont is also the safest state for walking with 0.9 pedestrian

Sources: FARS 2007-2009, ACS 2007-2009 **Notes:** This ranking is based on the fatality rate which is calculated by dividing the number of annual pedestrian fatalities (averaged between 2007-2009) by population (weighted, or multiplied, by share of the population walking to work). View these data on pages 56 and 62 of this report. (1) Percentage of fatalities that are bicyclists in cities is greater than nationwide, but a higher number of people biking in cities makes the fatality rate lower for cities than nationwide.

Pedestrian Risk by State

Bicyclist Risk by State

Source: FARS 2007-2009, ACS 2007-2009 **Notes:** These maps use a fatality rate calculated by dividing the number of annual bicycle and pedestrian fatalities (averaged between 2007-2009) by population (weighted, or multiplied, by share of the population biking and walking to work—to adjust for exposure). Because of the approximate nature of the exposure data and great fluctuations in fatality data from year to year, this rate should be seen as a rough estimate.

Photo by Kate McCarthy

deaths per 10,000 daily pedestrians. Florida (17.0 deaths per 10,000 daily pedestrians) is followed by Louisiana (12.0 deaths per 10,000 daily pedestrians), and South Carolina (11.7 deaths per 10,000 daily pedestrians) as the least safe states for walking. Boston, Omaha, and Minneapolis have the lowest pedestrian fatality rates among major U.S. cities with 0.9, 1.6, and 1.6 pedestrian deaths per 10,000 daily pedestrians, respectively. Fort Worth has the highest pedestrian fatality rates with 20.0 pedestrian deaths per 10,000 daily pedestrians.

Emerging Trends

Traffic fatalities are on the decline throughout the U.S., including those involving bicyclists and pedestrians. Between 1995 and 2009 the number of

3% of traffic fatalities in major U.S. cities are bicyclists.

Honolulu, Milwaukee, and Omaha have the lowest number of annual reported bicycle fatalities (0) among the largest U.S. cities. Fresno has the greatest percentage of fatalities that are bicyclists: 9.9% of traffic fatalities are bicyclists although only 0.7% of commuters bicycle to work.

Legend:

Ø = Not applicable
 = High value

Sources: FARS 2007-2009, ACS 2007
Notes: (1) All fatality data are based on the 3-year average number of fatalities from 2007-2009. (2) Bicyclist fatality rate was calculated by dividing the number of annual bicycle fatalities (averaged between 2007-2009) by population (weighted, or multiplied, by share of the population biking to work). (3) All averages are weighted by population except annual reported bicycle fatalities.

Looking Outside the Borders

Pedestrian and Bicyclist Fatalities and Injuries

In an effort to foster safety for bicycling and walking, it is also crucial that the U.S. look to other countries to see what safety levels have been achieved. One such comparison by Pucher and Buehler (2010; chart this page) found that the U.S. has the highest rates of bicyclist and pedestrian injuries and fatalities when compared to four other developed countries: the UK, Germany, Denmark, and the Netherlands.

The bicyclist fatality rate, calculated as bicyclists killed per 100 million km bicycled, is 1.7 times greater in the U.S. than any of the other four countries. For every 100 million km bicycled in the U.S. there are 5.5 bicyclist fatalities. The UK has the next highest bicycle fatality rate with 3.3 bicyclist fatalities per 100 million km cycled. The U.S. also leads the UK for bicyclist injuries. In the U.S., there are 33.5 bicyclists injured per 10 million km bicycled. This is nearly six times the U.K. rate of 5.7 bicyclists injured per 10 million km bicycled. The Netherlands is the safest country for cycling, with by far the lowest fatality and injury rates.

Pedestrian fatality rate was calculated with a similar method—pedestrians killed per 100 million km walked. The U.S. pedestrian fatality rate of 9.7 fatalities for every 100 million km walked is 2.7 times greater than that of any other country studied. The UK is again behind the U.S. with 3.6 pedestrian fatalities per 100 million km walked. More than 13 pedestrians are injured for every 10 million km walked in the U.S. This compares to 3.3 pedestrian injuries in the UK. The Netherlands also leads other countries in pedestrian safety

having the lowest rate of pedestrian fatalities and injuries.

An examination of bicyclist and pedestrian fatalities since 1970 reveals that other countries are experiencing the same decline in fatalities as the U.S. The U.S., UK, Denmark, Germany, and the Netherlands have all seen a general downward trend in number of bicyclist and pedestrian fatalities over the last four decades. However, the U.S. again lags behind international peers with the least decline while the Netherlands has seen the greatest decline in fatalities.

Pedestrian Safety in Cities

Pedestrians account for 27% of traffic fatalities in major U.S. cities.

Despite comprising 5% of trips to work and nearly 13% of all trips, pedestrians in major U.S. cities account for over a quarter of traffic fatalities. In Honolulu, New York, and San Francisco, roughly half of all traffic fatalities are pedestrians. Boston has the lowest pedestrian fatality rate.

■ = Low value

Sources: FARS 2007-2009, ACS 2009

Notes: (1) All fatality data in this table are based on the 3-year average number of fatalities from 2007-2009. (2) Pedestrian fatality rate was calculated by dividing the number of annual pedestrian fatalities (averaged between 2007-2009) by population (weighted, or multiplied, by share of the population walking to work). (3) All averages are weighted by population except for annual reported pedestrian fatalities.

City	Annual reported pedestrian fatalities (1)	Ped. fatalities Rate per 10K daily peds (1,2)	% Of all traffic fatalities that are pedestrians (1)	% Of pedestrian fatalities (1)

Sources: FARS 2007-2009, FHWA FMIS 2006-2010, LAB 2011 Notes: (1) Fatality data in this table are based on the 3-year average number of fatalities from 2007-2009. (2) State highway funds represent funding from the federal Highway Safety Improvement Program (HSIP).

bicyclists killed in traffic in the U.S. decreased by 27%. Pedestrian fatalities fell 24% over the same period. Pedestrian fatalities have experienced a steady decline with 2009 being a record low year for fatalities.

When looking at trends in bicycle and pedestrian fatalities over the last three decades, pedestrian fatalities have steadily declined in every age group. While bicycle fatalities among children under 16 have declined sharply in this time period, fatalities in the 16 and older age group have steadily increased. However, these charts do not take into account the change in number of people who bike or walk in these age groups. For example, the number of children who bicycle or walk to school has decreased 75% between 1966 and 2009. When walking and cycling levels have declined at such rates, then reduced fatalities do not necessarily suggest safer walking and cycling.

Safety Policy

Though almost all of the policies discussed in the following chapter could impact safety, this chapter takes a closer look at state highway safety policy. The federal Highway Safety Improvement Program (HSIP) is a federal funding program that aims to reduce traffic deaths and injuries through infrastructure-related improvements. States must have a state highway safety plan to be eligible for these funds. Twenty-seven states emphasize bicycling in their state highway safety plan and 31 states emphasize walking. However, the rate at which states obligate safety funds to bicycling and walking is disproportionately low compared to the percent of traffic fatalities these modes represent. While 13.6% of traffic fatalities are bicyclists or pedestrians, just 0.4% of state highway safety funds are directed at these modes. This amounts to just one cent per capita toward bicycle and pedestrian safety from this fund.

4: POLICIES

Research shows that better policies for bicycling and walking lead to higher levels of bicycling and walking (Pucher and Buehler 2007 and 2008, Pucher et al., 2010). The cities and countries that have invested most heavily in these modes see the greatest share of trips by bicycle and foot (Gotschi and Mills 2009).

For benchmarks in this chapter the Alliance relied on state and city surveys, the National Transportation Enhancements Clearinghouse, the Federal Highway Administration's (FHWA) Fiscal Management Information System (FMIS), League of American Bicyclists' Bicycle Friendly States data, Safe Routes to School National Partnership, National Center for Safe Routes to School, the Rails-to-Trails Conservancy, and the American Public Transportation Association. The Alliance sent surveys to all 50 states and the 51 cities included

in this report. State and city surveys were answered by local advocates and government officials (department of transportation employees, state bicycle and pedestrian coordinators, state Safe Routes to School coordinators, and city planning staff) (for more information on this process, see Chapter 1, page 26). State/city survey data are self-reported by cities/states. Respondents received follow-up only where data appeared inconsistent. Whenever possible, a note is included at the bottom of tables and illustrations noting cities and states that were unable to supply data.

This chapter focuses more heavily on cities since they are where provisions can best be measured. However, not all cities were able to report on bicycling and walking provisions because their agencies have not implemented methods to collect these data and thus have no data available.

Bicycling and Walking Policies

Strong policies to provide provisions for and promote bicycling and walking can help transform communities into healthier and more livable places. This report considered a number of policies such as complete streets policies, bicycle parking policies, annual spending targets for bicycle and pedestrian projects, published goals to increase bicycling and walking, and published goals to decrease bicycle and pedestrian fatalities.

Planning for Bicycling and Walking

Published Goals

When states or cities publish goals to increase bicycling and walking and decrease crashes, they are making public commitments to progress for which success can be easily measured. Since the 2010 Benchmarking Report, states and cities have improved in this area with several adopting new goals in the last two years. Thirty-four states report they have published goals for increasing *both* bicycling and walking. Mississippi has a goal to increase walking only. Nevada has a goal to increase bicycling only. This is up from just 16 states that reported goals for increasing bicycling and walking in 2007 and 20 states as of the 2010 Benchmarking Report.

Similarly, more cities have now adopted goals to increase bicycling and walking. Of the cities surveyed, 36 have goals to increase walking and 46 have goals to increase bicycling. Two years ago just 20 and 33 of these cities reported having such goals, respectively.

States and cities are also increasing their commitment to bicycling and walking safety. Forty-one states report having adopted goals to decrease pedestrian fatalities and 38 have goals to decrease bicycle fatalities. Of the cities surveyed, 39 have adopted goals to reduce bicycle fatalities and 31 have adopted goals to decrease pedestrian fatalities. Just 20 of these cities reported having goals to reduce bicycle and pedestrian fatalities in 2007.

Master Plans

Planning is an integral step to creating healthy livable communities. Bicycle and pedestrian master plans set communities' visions for the future and their road maps for achieving their goals. Roughly half of cities and states have adopted master plans for bicycling and walking as of this report. Twenty-four states have bicycle and pedestrian master plans. Hawaii, Minnesota, and Nevada have bicycle master plans only. Rhode Island has a pedestrian master plan only. Colorado is currently developing a bicycle and pedestrian master plan, and Hawaii is currently developing a pedestrian master plan. Twenty-one of the cities surveyed have bicycle and pedestrian master plans. Twenty more have bicycle master plans only.

Many states and cities have also adopted master plans for trails and mountain biking. Two-thirds of states report having adopted a trail master plan. Florida, Kansas, New Jersey, and Virginia have mountain bike plans. Florida's mountain bike plan is included in its state trail plan. Twenty-seven cities have trail master plans. Three of these focus on mountain biking. (For links to sample bicycle and pedestrian master plans, see Appendix 5, pages 213 and 214).

Source: City surveys 2010/2011 **Notes:** For legend, see previous page. The following top 51 population cities did not respond to these survey questions: Cleveland, Detroit, and Indianapolis; Responses of "na" and "unknown" were taken to mean "no." Cities with combined bike/ped master plans have both columns marked; cities with separate bike and ped master plans have respective columns marked. Cities with combined bike/ped advisory committees have both columns marked; cities with separate bike and ped advisory committees have respective columns marked. (1) Mountain bike plan. (2) A previously formed advisory committee has since dissolved.

Advisory Committees

In many states and cities, bicycle and pedestrian advisory committees assist with the planning, development, prioritizing, and implementation of bicycling and walking programs and facilities. These committees are typically comprised of volunteer community stakeholders such as bicycle and running club leaders, bicycle shop owners, advocacy leaders, and concerned citizens. Groups typically meet monthly or quarterly to review and make recommendations to city or state staff and planners about facilities, programs, and issues relating to bicycling and walking in their state/community. Twenty-six cities and 24 states that were surveyed report having a bicycle and pedestrian advisory committee. Ten cities have bicycle advisory committees only as do the states of Kentucky and North Carolina.

Complete Streets Policies

The bicycle and pedestrian advocacy movement and its partners for transit and disabled rights have adopted the term “complete streets” because it accurately frames the discussion to show that a street is not complete unless all modes of transport are provided for. A complete street provides safe access for pedestrians, bicyclists, children, the elderly, disabled people, transit users, and motorists. Complete streets policies require that all streets are designed and built to provide safe access for all potential users. These policies ensure that provisions such as sidewalks, curb cuts, bike lanes, traffic calming, and inviting crossings are included in all road projects and not as an optional add-on. According to the National Complete Streets Coalition (as of September 2011), 26 states and 19 of the 51 cities in this report have adopted local complete

Complete Streets Policies

Source: National Complete Streets Coalition, September 2011 **Note:** Only cities out of the 51 cities included in this report are included on this map. As of August 2011 there are 283 local jurisdictions with written policies—see www.CompleteStreets.org for details. California has an existing Complete Streets policy from 2001, but new policies were also adopted in 2008 and 2010.

streets policies. This is up from 2007 when just 10 states and 8 of the 51 cities had adopted complete streets policies. In total, there were 283 local complete streets policies in the U.S. as of August 2011. (For links to complete streets resources and model policies, see Appendix 5, page 214.)

Bicycle Level of Service

Level of Service (LOS) is a rating system used by transportation engineers, planners, and authorities to evaluate the speed, convenience, and comfort of roadway facilities. LOS most often assigns a letter grade to roadways, making the rating easy to understand. LOS has been used traditionally in highway planning, and the values assigned to roads can affect funding and other policy decisions. Although traditional LOS models have not included ratings for bicycling and walking, multimodal LOS models

are becoming more common in some places. According to data from the League of American Bicyclists, 17 states use the bicycle LOS rating to assess roads.

Bicycle Parking Requirements

Over 1.5 million bicycles are stolen in the United States each year (www.stolenbicycleregistry.com/links.php). In a 2008 survey of roughly 1,800 San Francisco bicyclists, the number one reason bicyclists cited why they don't bicycle more was fear of theft (Report Card on Bicycling: San Francisco 2008).

A lack of safe places to park a bicycle is a barrier to increasing bicycling (Hunt and Abraham 2007). Many cities have taken steps to overcome this barrier by requiring businesses and new developments, parking garages, and public events to include bicycle (Continued page 74)

Over 1/2 of states have now adopted a complete streets policy.

parking. Of the cities surveyed for this report, 76% (39 cities) require bicycle parking in new buildings. This is a 70% increase from 2 years ago when just 23 cities reported having this policy. Twenty-eight cities report that they require bicycle parking in buildings / garages—up from just 15 cities 2 years ago. Just nine cities require secure or valet bicycle parking at public events.

A 2002 comparison of bicycle parking requirements in 145 jurisdictions reveals that these policies typically require bicycle parking between 2% and 20% of car parking (Comparison of Bike Parking Policies). Some policies are triggered by minimum requirements such as the square footage of a building, the number of employees a business has, or the number of car parking spaces. In these cases, if the minimum is not met (such as a business having under 25 employees), a business is not required to install any bicycle parking.

Car Parking Requirements

The Alliance also surveyed cities on policies requiring a minimum and / or maximum number of car parking spaces for new buildings. Ninety-two percent of responding cities (47 cities) reported having minimum car parking requirements. By masking the true cost of land and parking space, these policies can often negatively affect land-use development that promotes bicycling and walking and lead to sprawl (Shoup 2005). On the flip side, 15 cities (up from six as of the 2010 report) reported having policies that set a maximum number of car parking spaces for new buildings. These progressive policies require more dense development and land-use practices that can encourage

safer and more friendly environments for bicyclists and pedestrians.

Driver Enforcement

Enforcement is one of the five Es for creating a bicycle and pedestrian friendly community. (Engineering, Education, Encouragement, and Evaluation are the other four.) Enforcement generally includes laws protecting both bicyclists and pedestrians and the enforcement of these laws. Although it is commendable to have laws that protect bicyclists, pedestrians, and other road users, these laws are less effective if not enforced. Whether it's ticketing speeding motorists or reminding bicyclists to stop at traffic lights, enforcement is critical to ensuring that safety rules keep road users safe.

For this report the Alliance collected data on a number of laws and policies. Relating to driver enforcement, surveys asked cities if they cite drivers for not yielding to bicyclists and pedestrians. Forty-three of the cities surveyed report that their city fines motorists for not yielding to bicyclists and pedestrians when nonmotorized users have the right of way. Of the cities that do enforce not yielding to bicycles and pedestrians, fines range from \$35 to \$300. The average fine for motorists is \$152.

Safe Routes to School Policies

Through the 2005 federal transportation act, \$978 million was provided to fund Safe Routes to School programs in all 50 states and the District of Columbia. As part of this legislation, each state was mandated to hire a full-time Safe Routes to School Coordinator. As of March 2011 all states have a full-time Safe Routes

to School coordinator in place. Three of these states (Illinois, Maine, and South Dakota) have interim coordinators.

States were asked what percentage of their schools participate in Safe Routes to School programs. According to this survey, on average, 14% of public schools are engaged in a Safe Routes to School program. Nevada has the highest participation rate with 39% of schools involved with Safe Routes programs. Oklahoma reported the lowest participation rate with just 1% of schools involved with Safe Routes.

Funding SRTS

The Alliance asked states if they use any additional funding sources for SRTS besides federal SRTS dollars. Eighteen states reported using additional funding sources for SRTS. Among the other funding sources used by states are state funds, Transportation Enhancement, state license plate sales, and private foundation funding.

School Siting Policies

The Alliance also asked cities and states whether they have a policy setting minimum acreage requirements for school siting. These requirements can often lead to sprawl by forcing new schools to be built far away from urban and suburban centers, and create poor conditions for bicycling and walking to school (McDonald 2007). These same conditions may negatively influence participation in after school and weekend activities at the school grounds (such as science club, scouts, arts and cultural enrichment, sports, etc.). Twenty-five states have minimum acreage policies for school siting. These policies vary but on average require a minimum

imity to their homes. Desegregation busing, the practice of assigning and busing students to schools to diversify student demographics, is one common policy that forces children to attend schools outside of their neighborhood consequently making walking and biking to school more difficult.

Bike Parking at Schools

The Alliance also asked cities how many bike parking spaces were at public schools. Cities averaged 26 school bike parking spaces per 1,000 students. Phoenix reported 16,000 bicycle parking spaces at schools—more than any other city. Mesa, AZ, had the highest rate of bicycle parking at schools with 87 spots per 1,000 students.

Spending Targets

Spending targets are goals set by states and cities for how much money, or what

percentage of transportation spending, will be allocated to bicycling and walking. Most states and cities report that they do not have spending targets for bicycling and walking. Just 11 states (Connecticut, Hawaii, Iowa, Maine, Michigan, North Carolina, Oklahoma, Oregon, South Carolina, Virginia, and Washington) report having spending targets—up from eight states as of the 2010 report. Thirteen cities (Albuquerque, Austin, Cleveland, Colorado Springs, Columbus, Fresno, Honolulu, Las Vegas, Louisville, Nashville, Phoenix, Portland, and Washington, DC) report having spending targets—up from seven cities as of the 2010 Benchmarking Report. Some spending targets are based on percentage of transportation spending (Hawaii 2%, Rhode Island 4%). Columbus's target is over a 20-year period. Other states and cities set dollar amounts as annual spending targets.

Sources: LAB 2011, Governors Highway Safety Association 2011 **Notes:** (1) Has handheld cell phone ban for 18-20 yrs old. (2) Hawaii does not have a state law banning the use of handheld cell phones. However, all of the state's counties have enacted distracted driving ordinances. (3) Illinois bans the use of handheld cell phones while driving in a school zone or in a highway construction zone. (4) Yes with learner or intermediate license. (5) Yes in state vehicles. (6) Utah's law defines careless driving as committing a moving violation (other than speeding) while distracted by use of a handheld cell phone or other activities not related to driving. (7) Oregon's safe passing law does not specify 3-feet, but defines a safe distance as: "distance that is sufficient to prevent contact with the person operating the bicycle if the person were to fall into the driver's lane of traffic vehicle."

Legend:

✓ = Yes/has legislation
Ø = not applicable

State Legislation

Can Bicyclists Legally Ride Two Abreast?

Most states have laws that allow bicyclists to ride side by side or "two abreast" as long as they are not impeding traffic. Riding two abreast is often preferred for bicyclists riding with a companion and can make bicycling a more enjoyable experience, like sitting beside a friend in a bus, train, or car. Forty-five states have legislation allowing bicyclists to ride two abreast. Hawaii, Iowa, Montana, Nebraska, and South Dakota are the only states where there is no legislation allowing bicyclists to ride side by side.

Safe Passing Laws

In recent years many states have successfully pursued legislation that requires motorists to pass bicyclists at a set "safe" distance. These "Safe Passing" or "3-Foot" laws, as they're often called, are primarily aimed at educating motorists how to safely pass bicyclists. Motorists may believe that just avoiding contact with bicyclists is all that is required when passing. Many motorists are unaware of the dangers of passing a bicyclist too closely which may lead to the bicyclist being hit or startled resulting in a crash. The other benefit of safe passing laws is to give police the authority to charge drivers who hit cyclists. If a motorist hits a cyclist, by definition he or she failed to give three feet. Twenty-one states now have safe passing laws on the books (up from 14 as of the 2010 Benchmarking Report).

Distracted Driving Laws

Distracted driving has received increased attention in recent years, especially as cell phones and texting have become more prominent. In 2009, distracted driving was responsible for

roughly 16% of traffic fatalities (nearly 5,500 victims) (USDOT 2011). Recent research has shown that strong laws with strong enforcement can significantly reduce distracted driving and save lives (Cosgrove et al., 2011). As of this report, only nine states ban handheld cell phone use by all motorists. Thirty-four states ban text messaging while driving.

Mandatory Bike Lane and Sidepath Use Laws

Although most state laws define bicycles as vehicles with the same rights and responsibilities as other vehicles on roadways, some states and municipalities have laws that prohibit bicyclists from full use of roadways when a bike lane or adjacent pathway is present. These "mandatory bike lane use" and "mandatory sidepath" laws can make it illegal for bicyclists to navigate traffic with the best vehicular tactics (such as merging left to avoid an obstruction, merging into the left lane to turn left, or not riding to the right of traffic in a turn lane) and restrict bicyclists' access to businesses or residences.

Most states, however, do allow bicyclists full use of the lane in traffic. Forty-two states allow the full use of the lane by bicyclists when a bike lane is present, and 42 allow use of the full lane in the presence of a sidepath. States that have mandatory bike lane use laws include California, Delaware, Florida, Kentucky, Maryland, New York, Oregon, and West Virginia. States that have mandatory sidepath laws include Alabama, Georgia, Kansas, Nebraska, North Dakota, Oklahoma, Oregon, and West Virginia.

Mandatory Helmet Laws

Although there is no federal law in the United States requiring helmet use for

bicyclists, starting in 1987, states and local jurisdictions began passing their own laws requiring helmet use. Twenty-one states report having a mandatory youth helmet policy. Typically these policies apply to youth under age 16. Mandatory helmet laws are controversial among bicycling proponents. For more information on these laws and the controversy around them, see Appendix 5, page 215.

Funding Bicycling and Walking

The most accurate uniform data on federal funding for bicycling and walking comes from the FHWA's FMIS accounting system. The funding data in this report (unless otherwise noted) depict a 5-year average of federal funds obligated to projects, and are not necessarily the actual amount spent in these years. Tables on pages 86-87 show both the federal dollars per capita for each state and city, and the percent of federal transportation dollars to bicycling and walking in each state and city.

The reliability of federal funding data is limited by the way various states report transportation spending to the FHWA. It is likely that bicycle and pedestrian spending is underreported when a larger road project has a bicycle or pedestrian component. Often, the entire project is coded as a highway project and therefore that state is not credited with spending the funds on bicycling and walking. This is becoming more of an issue for tracking and comparing spending by states with the rise in complete streets policies. With more states including bicycling and walking in all projects, it is increasingly difficult

Only 1.6% of federal transportation dollars are spent on bicycling and walking.

Percent of Federal Transportation Dollars to Bicycling and Walking

Source: FHWA FMIS 2006-2010 Note: Data are based on funds obligated to projects between 2006-2010 and are not necessarily the amount spent in these years.

Bicycle and Pedestrian Dollars by Funding Program

Source: FHWA FMIS 2010 Abbreviations: CMAQ = Congestion Mitigation and Air Quality Improvement Program; HSIP = Highway Safety Improvement Program; HPP = High Priority Projects; NTPP = Nonmotorized Transportation Pilot Program; Other STP = Surface Transportation Program (STP except Transportation Enhancement). Note: Data are based on funds obligated in 2010 and do not necessarily represent funds that were spent in this year. Figures are rounded to nearest whole percentage point and do not include American Recovery and Reinvestment Act funds.

Percent of Transportation Dollars to Bike/Ped

Source: FHWA FMIS 2006-2010 **Note:** Data are based on a 5-year average of funds obligated to projects between 2006-2010 and are not necessarily the amount spent in these years. Please note that this chart only reports state obligations of federal funding for bicycle and pedestrian projects. As states may utilize other sources of funding for bicycle and pedestrian programs as well, it is important not to assume that federal funding is the only source of funding for bicycle and pedestrian programs in any particular state. See disclaimer regarding differences in funding reporting on page 82 of this report.

According to data from the FHWA, Delaware and Washington spent the highest percentage on bicycling and walking among states—3.1% and 2.7%, respectively. Maryland, Oklahoma, and Virginia spent the lowest percentage on bicycle and pedestrian projects among states.

Delaware spends the greatest percentage of transportation dollars on bicycling and walking projects.

to track if states do not code the bike/ped portions of the project. When asked how their state reports projects, 29 states responded that they report stand-alone bicycle and pedestrian projects. Twenty-eight states responded that they report facilities that are part of larger projects. Five states did not respond or could not access this information.

Also, this report only includes obligations of federal funding for bicycle and pedestrian projects. As states and cities may utilize other sources of funding for bicycle and pedestrian programs as well, it is important not to assume that federal funding amounts included in this report are the only funding for bicycle and pedestrian programs in any particular state or city.

The variation in federal funding sources to bicycle and pedestrian projects is

relatively small, with the Transportation Enhancement (TE) program typically responsible for roughly half of all bike/ped obligations. (The American Recovery and Reinvestment Act, a temporary funding program, was the leading funding source for bicycle and pedestrian projects in FY 2010.) More than 50 additional federal funding programs have been used for bicycle and pedestrian projects, most at relatively small amounts. Overall, states spend just 1.6% of their federal transportation dollars on bike/ped projects (based on the 5-year funding period from 2006-2010). This amounts to just \$2.17 per capita for bicycling and walking each year. The variation in per capita funding and the percentage of transportation dollars spent on bicycle and pedestrian projects are great among both cities and states. This fact indicates that states and local

Notes: See disclaimer regarding differences in funding reporting on page 82 of this report.

(1) Blank cells should be understood to mean a "no" response. (2) Data are based on the 5-year average of funds obligated to projects between 2006-2010 and are not necessarily the amount spent in these years. FHWA projects are coded by "urbanized area," county, and "standard place code." Data were sorted by urbanized area, standard place code, and then county code to most accurately capture a particular city's funding amount. Because not all projects include all codes, these figures should be seen as approximate estimates for each city. (3) Weighted average. (4) Due to large amounts of deobligated funds in the 5-year period between 2006-2010, accurate funding estimates could not be obtained for this city. (5) City did not respond to 2010/2011 survey, data from previous year. (6) In 2009 Dallas obligated \$16.7 million from ARRA toward "The Park," a major bicycle/pedestrian/open space project. Another \$20 million will come from state and federal highway funds, which may explain the large amount of funding to bike/ped in this period.

jurisdictions play a significant role in determining how their federal transportation dollars are spent.

Unfortunately, this has meant that often bicycle and pedestrian projects not only receive a smaller than fair share of funds, but are also disproportionately targeted for rescissions. Since 2002, Congress has enacted rescissions, removal of apportioned funding before the funding is set to expire, that have affected transportation funding. In most years, states have had discretion as to how much to rescind from programs such as the Transportation Enhancement program as opposed to other federal-aid highway programs.

Transportation Enhancements

The Transportation Enhancement (TE) program is the best known funding source for bicycle and pedestrian infrastructure improvements. Of Transportation Enhancements funding, \$265 million, or 48%, is allocated to biking and walking infrastructure and programs annually, making it the most important federal funding program to track.

Bicycle and pedestrian projects are disproportionately affected by rescissions when states choose to rescind a greater percentage of TE funds than in other transportation funding programs. \$2.6 billion, or 21% of apportioned TE funding, has been rescinded since 1992.

In 2010, TE comprised 2.3% of apportionments but 26.4% of rescissions. This disparity was greatest in Nebraska where 100% of rescinded funds were TE. Texas, Nevada, and Arkansas also lead for disproportionately rescinding TE funds with 78.8%, 62.1%, and 54.5% of funds rescinded from TE, respectively. (Continued page 91)

Distribution of TE Funding by Category

Source: NTEC 2010 Note: (1) Numbers round up and so appear to add to less than 100%.

Distribution of TE Funding across Bicycle and Pedestrian Projects

Source: NTEC 2010 Note: (1) Numbers round up and so appear to add to more than 100%.

Percent of Transportation Enhancement Funding to Bike/Ped by State

Source: FHWA FMIS 2006-2010 Note: (1) Figures for this graph are based on a 5-year average of funds obligated to projects between 2006-2010 and are not necessarily the amount spent in these years.

Most TE funding (48%) goes toward bicycling and walking facilities, education, and safety. States vary greatly on how they spend their TE dollars. New Hampshire dedicates the greatest percentage of TE funds to bicycling and walking (88%); Oklahoma dedicates the smallest share to bicycling and walking (1%).

**48% of TE
funding goes
to bicycling
and walking.**

Transportation Enhancement Rescissions

What are rescissions?

Periodically, Congress rescinds, or cancels, unspent transportation funds from State DOTs. Rescissions are essentially a bookkeeping measure, which allows the USDOT to take long unspent funds off the books. However, some state DOTs have disproportionately drained bicycle and walking funding sources to build more highways.

What is at stake for bicycle and pedestrian projects?

The USDOT tells states how much money they have to give back, but state DOTs decide which unspent funds they will send back first. Historically, some of the strongest programs for bicycle and pedestrian projects—Transportation Enhancements (TE) and Congestion Mitigation & Air Quality (CMAQ)—suffer dramatically higher rescission rates than other programs. For example, TE and CMAQ made up just 7.3 percent of a state DOT's 2010 transportation apportionments, but they made up a much larger share of what a state sends back. In August 2010, out of the \$2.2 billion rescinded, \$968 million (44%) came from CMAQ and TE. (America Bikes 2011).

Safe Routes to School

Safe Routes to School (SRTS) is the newest federally funded program that is 100% dedicated to funding bicycle and pedestrian capital, education, promotion, and enforcement projects. The National SRTS program was signed into law, under the federal transportation legislation SAFETEA-LU, in 2005. Because the program is new, data are still sparse. The Safe Routes to School National Partnership and the National Center for Safe Routes to School have compiled data to measure the progress of states' Safe Routes to School programs. Data presented in this report include each state's number of schools funded, total funding awarded to and obligated by each state, percent of funding awarded based on requests, and percent of applications funded.

As of September 2011, approximately \$453 million has been obligated to 11,163 schools or programs through the federal Safe Routes to School (SRTS) program. This amounts to \$9.37 per public school student, roughly \$1.34/year/student.

Note: Sources and notes for this table on following page.

Legend: = High value = Low value
* = Data unavailable

The National Center for Safe Routes to School also collects data to track demand for Safe Routes to School programs. Data show that nationwide, just 44% of funding requests have been awarded (based on total funds requested). States vary on how they are meeting the demand for Safe Routes to School programs and projects, but in almost all cases funding requests exceed available funding. New Jersey and Illinois have the largest gaps between supply and demand and are able to fund just 19% and 20% of the total funds requested, respectively. Delaware, Washington DC, and Massachusetts best meet demand with current funding.

One hundred percent of funds requested have been awarded in these states. The Safe Routes to School National Partnership and the National Center for Safe Routes to School have leading roles in benchmarking Safe Routes to School performance and publish regular progress reports. See Appendix 5, page 216, for links to their websites and the most up-to-date measurements for Safe Routes to School.

Stimulus Bill Boosts Biking and Walking
In February 2009 the American Recovery and Reinvestment Act (ARRA) was signed into law. Known as the "stimulus bill," this legislation pumped money

(Table Page 92) Sources: (1) SRTSNP September 2011 (2) NCSRTS 2011 (3) STN 2011 (3) Total pupil data from STN 2011 takes into account grades K-12 whereas Safe Routes to School (SRTS) funding can only be spent on grades K-8. **Notes:** The District of Columbia is included in this table for comparison, although it is not compared to states in most other areas of the report; all dollar figures cited are as of September 2011. (4) "Announced" columns measure the amount of funding each state has announced for local grants and statewide spending—not including administrative expenses. These are the funds that will ultimately help local communities create safer routes to school. (5) "Obligated" columns reflect the amount that the state has expended or contracted to expend on Safe Routes to School, including local grants, statewide spending, and administrative expenses. Obligation is important as it demonstrates what level of funding has been or will soon be spent to build infrastructure projects, support noninfrastructure activities, and implement the program. (6) "Funded Schools/Programs" shows the number of schools in the state that are receiving SRTS funds or the number of state-funded SRTS activities. If the number of schools is not known, the number of SRTS programs is used. This number will usually be an estimate, because many funding recipients will conduct programs in numerous schools. Fund awards are typically made through a competitive process, but in some instances the state may directly select local programs to fund. (7) Total pupil data are representative of public schools only. (8) All averages are weighted except for number of funded schools/programs, total awarded funds, and total obligated funds.

Stimulus Bill Funding

Source: FHWA FMIS 2009-2010 Notes: The District of Columbia is included in this table for comparison, although it is not compared to states in most other areas of the report; (1) Total value (2) Weighted average (3) "TE ARRA" refers to ARRA funds that were directed toward the Transportation Enhancements program.

Legend: = High value = Low value

and jobs into the U.S. economy. Transportation is one sector that benefited from a large influx of funds in 2009 and 2010, and bicycling and walking also benefited.

The nearly \$750 million in stimulus funds that were obligated to bicycle and pedestrian projects in FY 2009 and 2010 is likely a large underestimate. It is common for bicycle and pedestrian projects to be coded incorrectly, thus undercounting spending rates. America Bikes explains:

For example, the state of Maryland obligated \$12.3 million, almost 100 percent of its ARRA TE money, to making sidewalks accessible, but it did not record this as a bicycle or pedestrian project. (America Bikes 2011).

This project would therefore not appear as dollars spent on bicycling and walking. Variation in how states record projects can dramatically affect how they appear to obligate funds to bicycling and walking.

Recognizing this, FMIS data indicate that bicycle and pedestrian projects accounted for 3% of all ARRA transportation funds in 2009 and 2010. In these years, over \$460 million in ARRA funding went to Transportation Enhancements, 59% of which were bicycle and pedestrian projects. Thirty-five percent of all bicycle and pedestrian funding in 2009 and 2010 was ARRA funds, accounting for a large spike in bike/ped funding compared to previous years.

States vary widely on how they chose to spend ARRA transportation funds. Massachusetts reported spending 11% of its ARRA transportation funds on bicycling and walking, the highest rate among states. Arkansas reported just 0.03% spent on bicycling and walking, amounting to just four cents per capita, the lowest among states. The District of Columbia, Hawaii, and Oklahoma spent 100% of ARRA TE funds on bicycling and walking projects while Arkansas and Virginia spent no ARRA TE funds on these modes.

Infrastructure

Just as road infrastructure has been implemented to facilitate safe and accessible routes for motorized vehicles, so too is appropriate infrastructure critical for safe and accessible routes for bicycling and walking (Hopkinson and Wardman 1996, McClintock and Cleary 1996, Reynolds et al., 2009, Rietveld 2000). To see how cities compared to one another on infrastructure for bicycling and walking, they were asked to

Looking Outside the Borders

Investing in Bicycling and Walking

Case studies show that the countries and cities that invest the most in bicycling and walking have higher bicycling and walking mode share, and are safer places to bicycle and walk (Pucher et al., 2010; Pucher and Buehler, 2007 and 2008). An international comparison of bicycle funding and mode share by Gotschi and Mills and Rails-to-Trails Conservancy (2008; chart this page) demonstrates that European cities that invest greater amounts per capita into bicycling have greater levels of bicycling. These cities provide strong evidence that in order to increase active transportation, the United States must make a much greater investment in infrastructure and programs encouraging bicycling and walking.

Bicycle Funding and Mode Share

Sources: This graph is modified with permission from Thomas Gotschi and Kevin Mills, *Active Transportation for America—The Case for Increased Federal Investment in Bicycling and Walking*, Rails-to-Trails Conservancy, 2008. www.railstotrails.org/atfa; modified from J. Pucher et al., 2007. "At the Frontiers of Cycling: Policy Innovations in the Netherlands, Denmark, and Germany," *World Transport Policy & Practice*; ACS 2007-2009, FHWA FMIS 2006-2010. **Note:** *Spending data for the United States and Portland are for bicycling and walking combined.

A quadruple-deck bike rack in Amsterdam is overflowing, a testament to the volume and prevalence of bicycling in the city. Photo by Jomilo75@ Flickr.

report on miles of existing and planned facilities including on-street striped bike lanes, multi-use paths, and signed bicycle routes. Cities averaged 1.8 miles of bicycle facilities (bike lanes, multi-use paths, and signed bicycle routes combined) per square mile. On the high end of the range is San Francisco, with 5.6 miles of bicycle facilities per square mile. Austin and Long Beach rank second and third, with 4.5 miles of facilities per square mile.

Cities average 19.2 miles of sidewalk per square mile. New York reported having 12,750 miles of sidewalk, more than any other city. Baltimore has the densest sidewalk network with 44.4 miles of sidewalk per square mile.

Cities were also asked to report on miles of planned bicycle and pedestrian facilities. Cities who responded reported that 20,908 miles of bicycle facilities and 7,079 miles of pedestrian facilities are planned for the coming years. New York has more planned bicycle facilities than any other cities (1,800 miles). Austin has 3,500 planned miles of pedestrian facilities, more than any other city (see chart page 99).

Innovative Facilities for Bicycling and Walking

A century of planning roads for cars means that planning for bicyclists, pedestrians, and other users will often require innovative designs and treatments to retrofit existing infrastructure. For the 2012 Benchmarking Report, the Alliance asked cities which, if any, of five innovative treatments they have used or adopted. (For data on innovative facilities, see page 104; for definitions of these facilities, see page 105.)

Photo by Frank Chen, San Francisco Bicycle Coalition

Shared lane markings, also called "sharrows," are the most common innovative treatment in use today. Thirty-seven cities report that they have used shared lane markings, up 95% from 19 cities two years ago. Ten cities report that they have implemented bicycle boulevards (up from five 2 years ago). Six more cities reported bicycle boulevards are currently under development or have been proposed. Nine cities have implemented bicycle traffic lights. Sixteen cities have used colored bike lane (Continued page 103)

Existing Bicycle Facilities in Major U.S. Cities

**Cities average
1.8 miles of
bicycle facilities
per square mile.**

San Francisco and Austin have the most miles of bicycle facilities per square mile among the largest U.S. cities. Fresno, Tucson, and Philadelphia rank highest for miles of bike lanes per square mile. Indianapolis, Oklahoma City, and Detroit have the fewest miles of bicycle facilities per square mile.

Source: City surveys 2010/2011, Census 2010 **Notes:** A survey response of "na" was taken to mean "0" for this table. (1) Weighted average. (2) Bicycle lane miles count both directions when bike lanes are on both sides of two-lane street. (3) Planned facilities includes only miles of new facilities and does not represent a combined value of existing and planned facilities. (4) Did not provide these data for 2010/2011 survey; value represents miles as of 2008/2009 Benchmarking survey. (5) Open-ended.

CLOSER LOOK

San Francisco's Burgeoning Bicycle Network

by Kit Hodge, San Francisco Bicycle Coalition

San Francisco, a hilly city 7 miles long by 7 miles wide (and roughly 800,000 people), has the highest density of biking infrastructure in the United States. And not coincidentally, it boasts seven in ten San Franciscans riding a bike in the city. Though the city still has a long way to go, with only about 8% of locals riding every week, San Francisco is an unexpected success story in the United States. After all, the city was prohibited by a local court case from adding any new bicycle infrastructure—even bike parking racks—for 4 years, from 2006 to 2010.

These were four very long years, during which bicycling in the city nevertheless grew at huge rates.

The success of the city can be boiled down to culture, expressed in two areas: a strong, member-driven advocacy organization and the culture of the city. The San Francisco Bicycle Coalition (SFBC) serves 12,000 members, as of July 2011. Members are the heart and soul of the organization, leading local bike infrastructure campaigns, staffing the nonprofit's

huge numbers of volunteer opportunities each year, voting in local elections, and providing the funding that it needs to do its work. The SFBC is hard to miss around town. Coalition members are out pretty much every week knocking on doors, parking bikes at events, tabling on street corners, and doing trainings in places of business. The city is just small enough to make this doable. As a result, it is hard to ignore the organization at City Hall.

City Hall is perhaps also primed to hear bicycle advocates even more than many other cities because of the unique culture of the city. San Francisco prides itself on its green policies, innovations, and culture of inclusion. These attributes can make it easier to sell newer ideas, such as innovative bicycle infrastructure, to elected officials. Though San Francisco is an ethnically diverse city, it is less economically diverse and can feel more culturally homogeneous than other big U.S. cities. This may make it more likely that the idealism, and values of sustainability, innovation, and inclusion are prevalent around the city.

Going forward, San Francisco is poised for an explosion in new bicycle infrastructure and ridership. And not surprisingly, the SFBC's bold plan for 100 miles of crosstown, 8-to-80 bikeways by 2020, called Connecting the City, is expected to be driven by the organization's members. Many of the projects called for to create these bikeways are long-desired street safety initiatives that local advocates have clamored for for years. The organization collects and tells their stories to decision makers, and ensures that they are invited to community meetings, have design input, and are empowered to speak at key hearings and in the media.

Growth in Bicycle Facilities⁽¹⁾ in Major U.S. Cities 2009-2011

Source: City surveys 2010/2011 **Notes:** Cleveland, Detroit, and Indianapolis only have 2009 data because no 2011 data were supplied. (1) For the purpose of this chart, bicycle facilities include bike lanes and multi-use paths.
